

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

no less than thirty-three individuals having been examined, or reported to me by accurate observers in various parts of the State.— B. H. BAILEY, *Cedar Rapids, Iowa*.

Chimney Swift Nesting in a Well.— On July 23, 1916, Mr. S. V. LaDow and I hopefully approached a well in an open field between houses along a highroad near Westfield, Bergen Co., N. J. It was a rather fancy well, with a curb about a yard high and four columns supporting a pointed roof, the whole affair of stone. But we found it evidently unused, as the water was about twenty-five feet down, scummy and with no means of drawing it. As we sat on the curb, a strange noise came from below; on repetition, we decided that it was of wings, probably a bat's. Hitting the inside of the well with a stick caused further repetition. Long looking revealed three blind, naked, pink-skinned Swifts (*Chætura pelagica*) in a nest attached to the smooth, rounded concrete wall about seven or eight feet down, and finally an adult (disclosed by the whitish throat) perched a little to one side, also against the concrete. The young wriggled a little and made faint but distinct squeaking. We withdrew and after a few minutes returned and found the old Swift sitting on the nest covering its babies, its face toward the wall.

As after gazing sorrowfully at the water, we had sat quietly for a space before the Swift flew, and as it had not flown upward to any extent as though to escape, perhaps the rather loud noise of the wings in flight was made to scare us away.

Though the file of 'The Auk' contains occasional records of the Chimney Swift's nesting in hollow trees and in buildings, I have found no record there or elsewhere of a nest in a well except in Bendire's 'Life Histories of North American Birds,' 1895, p. 178: "In a letter from Dr. William L. Ralph, dated San Mateo, Florida, May 19, 1895, he says: 'One of my men brought me the eggs of a Chimney Swift that he said he took from a nest attached to the sides of a well, 4 feet below the surface of the ground. He says they often nest in such places in this vicinity.' I consider this as a very unusual nesting site for this species."— CHARLES H. ROGERS, *American Museum of Natural History, New York*.

***Muscivora tyrannus* (Linn.) in Massachusetts.**— On October 22, 1916, I saw a Fork-tailed Flycatcher perched on the top of a wire fence at the side of the main road a short distance below Gay Head Lighthouse, Martha's Vineyard, Mass. When disturbed by my repeated approach, the bird flew only a short distance each time, and returned to the fence. The conspicuously long outer tail-feathers and general coloration made it easily recognizable. Subsequently, by the kindness of Mr. Outram Bangs, of the Museum of Comparative Zoölogy, I have examined specimens of this and other species, which entirely confirm my identification.— FRANCIS A. FOSTER, *Edgartown, Massachusetts*.
